

Amadeus Property Management Advanced (APMA)

Release Notes

Duetto v7 Interface

Duetto is a revenue management system (RMS) that provides pricing, financial forecasting, and group business solutions that will optimize a property's revenue strategy.

- The Amadeus-Duetto PMS integration works with IDPMS (OnPremise) and APMA (Cloud).
- The interface provides Duetto with availability and reservation data from the PMS. With this data, Duetto creates rate and restriction recommendations that are directly loaded into the IDPMS/APMA rate grid.
- The interface is a 2-way integration known as a push/push setup and is fully based on HTNG API messages.

- IDPMS/APMA sends the following data:
 - Upload of hotel statistics such as history and forecast
 - Reservation information, both historical and future
 - Rate plan information
 - Availability information
 - Future allotment and group block data for the purpose of group commit counts
 - Inventory counts such as Out of Order and/or Out of Inventory rooms
 - The PMS pushes each change to Duetto in 3-minute intervals. Messages received from Duetto are processed in real time.
- Duetto can send the following data to the IDPMS/APMA:
 - Rate values and updates
 - Only rate updates with a rate type, room type, and a rate date combination are supported at this time
 - Rate restrictions
 - Only restrictions with a rate type and room type combination with a specific date or date range are supported at this time
 - Overbooking levels by property total or room type total
 - Duetto processes inbound HTNG messages in 10-minute intervals
 - This improves Duetto's application performance by reducing the frequency of recalculations.

- DuettoV7 with ASync processing sends response messages when upload requests are complete.
- IDPMS version 4.1.7.141 or higher is required.
- Additional software requirements and configuration may be necessary.
